DETAILED ACTION

1. This Office action is responsive to communication filed on 02/16/09. Claims 1, 3, 4, 6-9, 11-15, 17-19, 21, 22 and 24-29 are pending.

Allowable Subject Matter

2. Claims 1, 3, 4, 6-9, 11-15, 17-19, 21, 22, 24-29 are allowed.
3. The following is a statement of reasons for the indication of allowable subject matter:

Regarding claims 1, 7, 13 and 19, the prior art of record fails to reasonably teach, singly or in combination, sending a Force Master command from the "slowest" client to a server to request to become the new master client, where the slowest client is determined by drop counters at each of the passive clients.

Li, et al (ORMCC: A Simple and Effective Single-Rate Multicast Congestion Control Scheme, 2002), the closest prior art of record, teaches the use of client feedback to determine the slowest client. ORMCC compares average Throughput Rate at Congestion (TRAC) metrics of all receivers to determine the slowest ones, and chooses one of them as the Congestion Representative (CR). The TRACs are measured at receivers upon packet losses. Clients having average TRACs low enough to qualify them as a CR will then send in Congesting Indications with TRAC ($CI(\mu)s$). By only having clients meeting such a requirement send in $CI(\mu)s$, ORMCC is able to

provide feedback suppression, and to determine the slowest client without knowledge of all clients.

In ORMCC the clients send feedback to the server, who then determines, based on all feedback received, which is the slowest client. The present claims distinguish over ORMCC by determining the slowest client at the passive clients, and, when a passive client determines itself as the slowest client, the slowest client sends a Force Master command to the server to become the new master client. This allows for the implementation of a single acker adaptive multicast system in a peer-to-peer network.
